

## ZERO EMISSION BUILDINGS CAN BE EVEN MORE SUSTAINABLE

To reduce the carbon footprint in buildings the traditional approach is focused on reducing the operational energy consumptions

**BEFORE THE BUILDING BECOMES OPERATIONAL**  
a relevant amount of CO<sub>2</sub> is produced during the manufacturing of materials, their transportation and the construction processes

**Embodied carbon**

**Operational carbon**  
CO<sub>2</sub> emissions produced using and managing the building

**AT THE BUILDING END-OF-LIFE**  
CO<sub>2</sub> emissions are produced demolishing the buildings, transporting and recycling the wastes

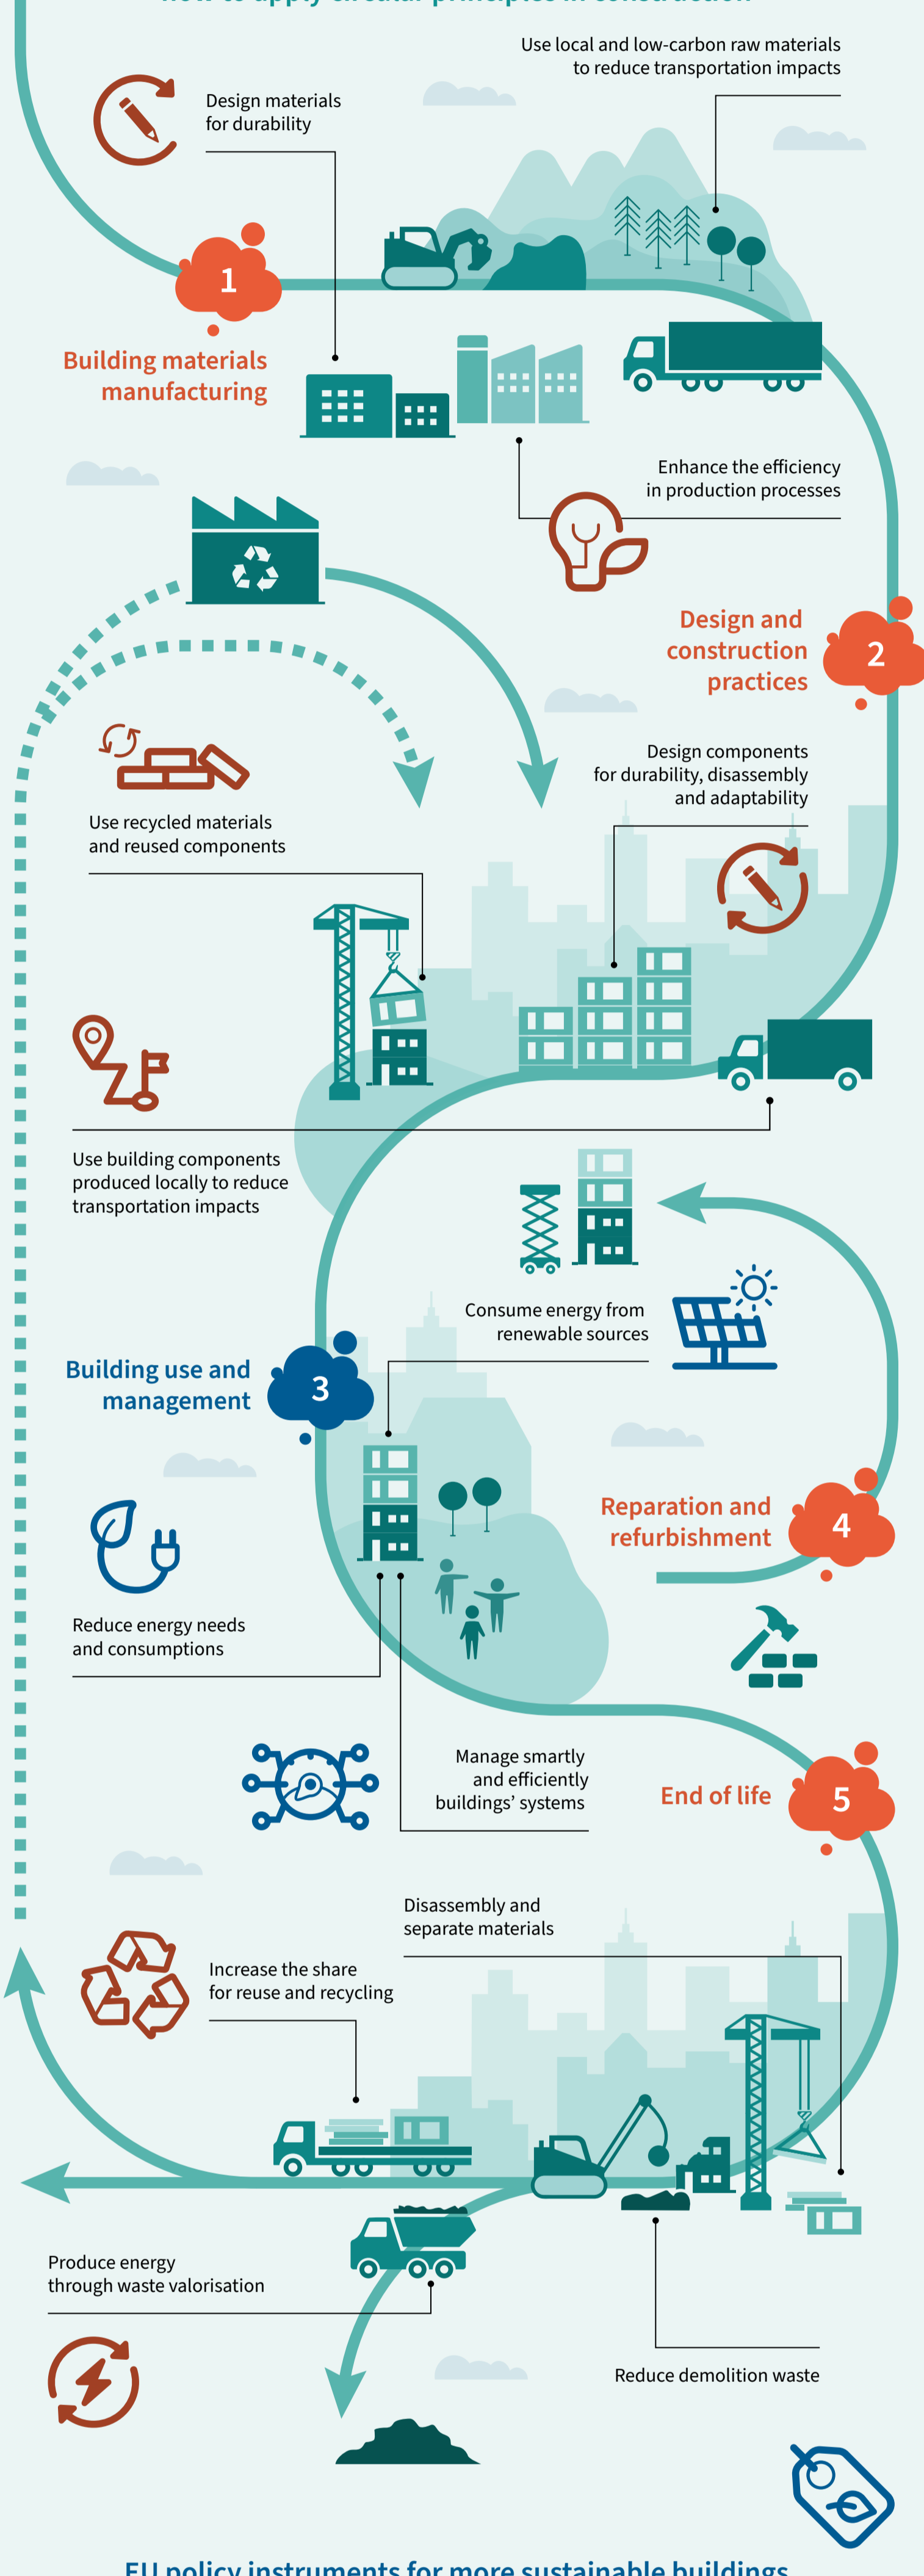

Global trends in life cycle emissions of buildings, average kgCO<sub>2</sub>e/m<sup>2</sup>a

Thanks to advances in reducing operational carbon, embodied carbon is becoming a larger portion of a building's overall carbon footprint

In 2018 the European Commission launched Level(s), an assessment and reporting tool for sustainability performance of buildings, firmly based on circularity

Level(s) provides a common language using indicators covering all life-cycle stages and grouped in 6 macro-objectives

- 1** Greenhouse gas emissions along a buildings life-cycle
- 2** Resource efficient and circular material life-cycles
- 3** Efficient use of water resources
- 4** Healthy and comfortable spaces
- 5** Adaption and resilience to climate change
- 6** Optimised life-cycle cost and value

#### What's in it for you?

<p><b>Built environment and sustainability professionals</b></p> <p>Support in comparing design options and setting sustainability targets from the beginning of the project</p>	<p><b>Policy makers / Procurers / Public authorities</b></p> <p>Help in developing and implementing policies and actions linked to sustainability</p>	<p><b>Investors / Property owners / Landlords</b></p> <p>Support in tracking and reporting the buildings performances throughout the full life-cycle</p>
